

PRACTICE OF IT PROVIDER MANAGEMENT

Course overview

More and more companies are outsourcing IT services to one or more service providers. Although the organizational design of the outsourcing is well prepared, problems often arise after having signed the contract: Either the provider does not adhere to specifications, or goals that have already been agreed upon are not implemented as desired. In most cases, it turns out that "soft" factors play a decisive role in successfully managing service providers. In our experience, cooperation with service providers should be managed in targeted manner at both the technical and the interpersonal level. In addition to organizational aspects, this includes in particular the development of a cooperative relationship that makes it possible to avoid conflicts with the service provider in advance, or to resolve them quickly and constructively if necessary. The provider manager plays a central role here: He pulls all the strings when it comes to effectively and successfully managing the factual and relationship levels of the collaboration.
